Press Release

World PI Week: Turning Hope into Action!

Seven days of action to call for early diagnosis and optimal care for patients with primary immunodeficiency

22nd-29th of April 2015 – For the fifth consecutive year the primary immunodeficiency (PI) community joins forces to celebrate World Primary Immunodeficiency week (WPIW). On this occasion patients, families and healthcare professionals work together to call for increased awareness of this devastating condition and mobilise to take it out of the shadow through concerted global action.

Under the slogan Test. Diagnose. Treat, World PI week unites, empowers and engages all global stakeholders in the PI cause. Together patients, nurses, physicians, scientists, allied health professionals, and industry will advocate for testing, optimal care and the best possible treatment – including access to prophylaxis Immunoglobulin (Ig) therapy, antibiotics, antifungal medications, bone marrow transplants, or gene therapy where appropriate. Primary Immunodeficiencies are complex diseases requiring complex therapies; while classified as rare, PI affects more than six million people worldwide, with no gender, age or geographical boundaries.

Primary immunodeficiency (PI) diseases occur in persons with an immune system that is either absent or deficient in its ability to function. PI can present in the form of “common” infections, sometimes leading physicians to treat the infections while missing the underlying cause, allowing the illnesses to reoccur, and leaving the patient vulnerable to vital organ damage, physical disability, or even death.

One in 1200 people are suspected to live with a genetic primary immunodeficiency that significantly affects their health. However lack of awareness means that between 70 to 90% of PI sufferers remain undiagnosed, with their healthcare practitioners treating PI related infections as common occurrences. With early diagnosis, proper care and optimal treatment the disease is manageable and can save patients from lifelong disabilities, unnecessary vaccinations and lengthy hospital visits. Detecting the disease early can improve patients’ conditions offering them all the opportunity to live full and rewarding lives.

This year for WPIW, we will address this awareness deficit with walkathons, community initiatives, social media outreach, lectures in schools, hospital symposia and media events including a global balloon launch in which balloons are released simultaneously,

to drive awareness of PI. This year will be the biggest lift off yet – over 110 locations around the world!

Test. Diagnose. Treat!
